Setup

Tooltip Manager

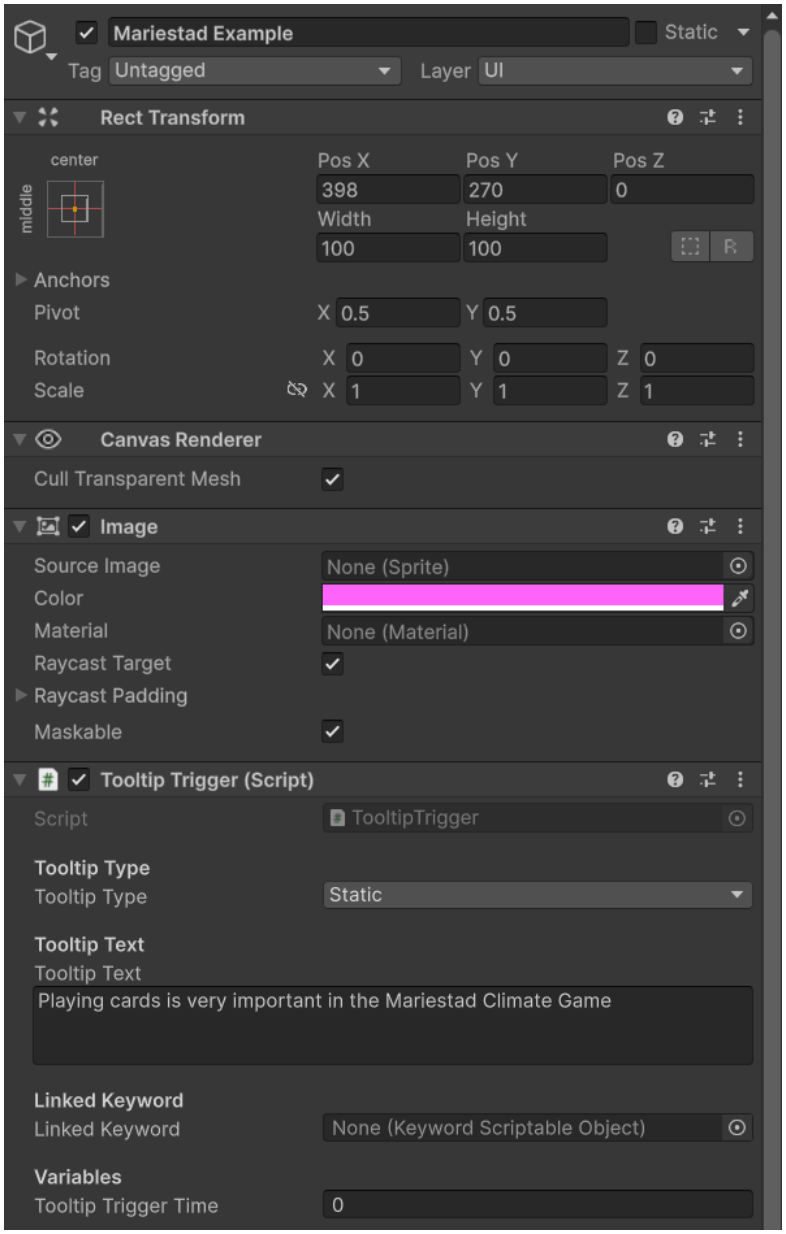

To set up tooltips you simply need to add the tooltipManager prefab to the scene.

It will come preset with default settings, though you can change settings in the inspector fields if you want.

UI Tooltip

After doing that you can add the tooltip trigger object to any UI object. The object needs to have raycast target set to be enabled, and there can’t be an object above it in UI blocking the raycast

This should create a tooltip like this

Linked Keyword Tooltip

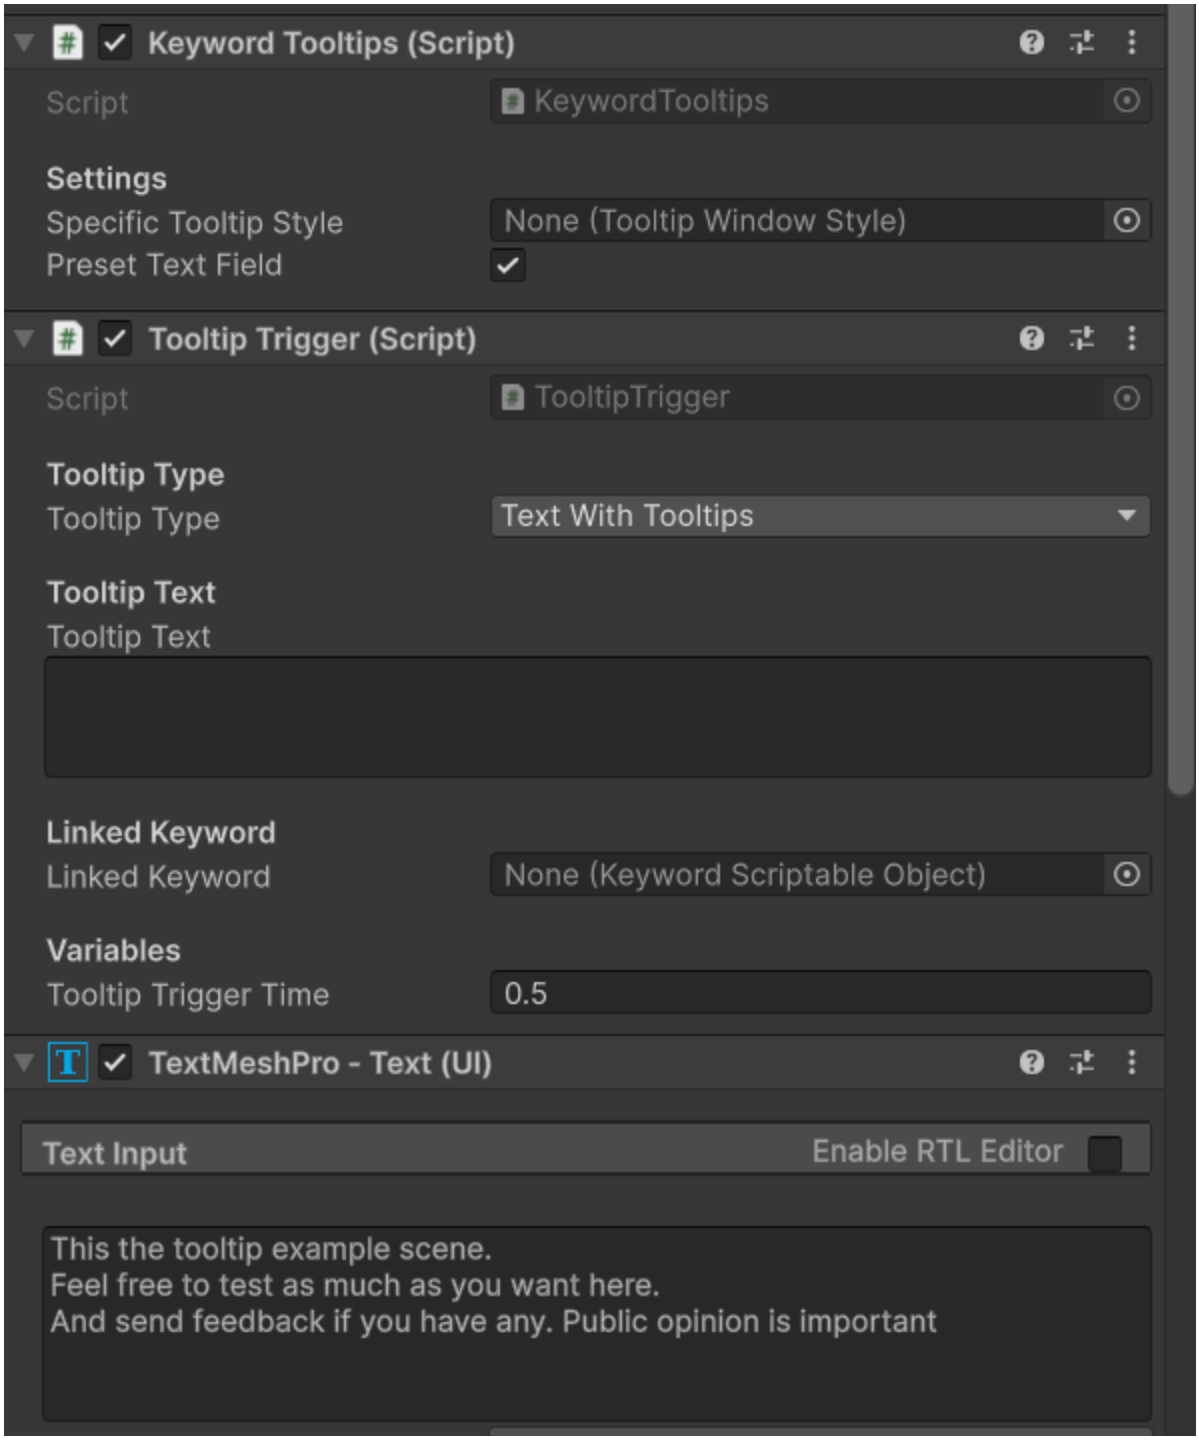

Another tooltip type is the linked keyword tooltip. These display the tooltip text of a keyword, making them update automatically if you update the keyword scriptable object.

Global tags are one of the six types of tags, symbolizing cooperation with other actors across the globe

Text With Tooltips

Finally there is the Text With Tooltips type, for if you want tooltips by keywords in one of your texts. These work using linked words, in the same way tooltips works. To do so set up a TextMeshPro Text UI object, add the Keyword Tooltip and Tooltip Trigger scripts, and set the latter to the type Text With Tooltips. If the text field at the start is the text you want to display, set Preset Text Field to true. If the text inside will be changing in game, you can call the AddKeywordsToText function on the KeywordTooltips script to update the text

Feel free to test as much as you want here.
And send feedback if you have any. Public opinion is important

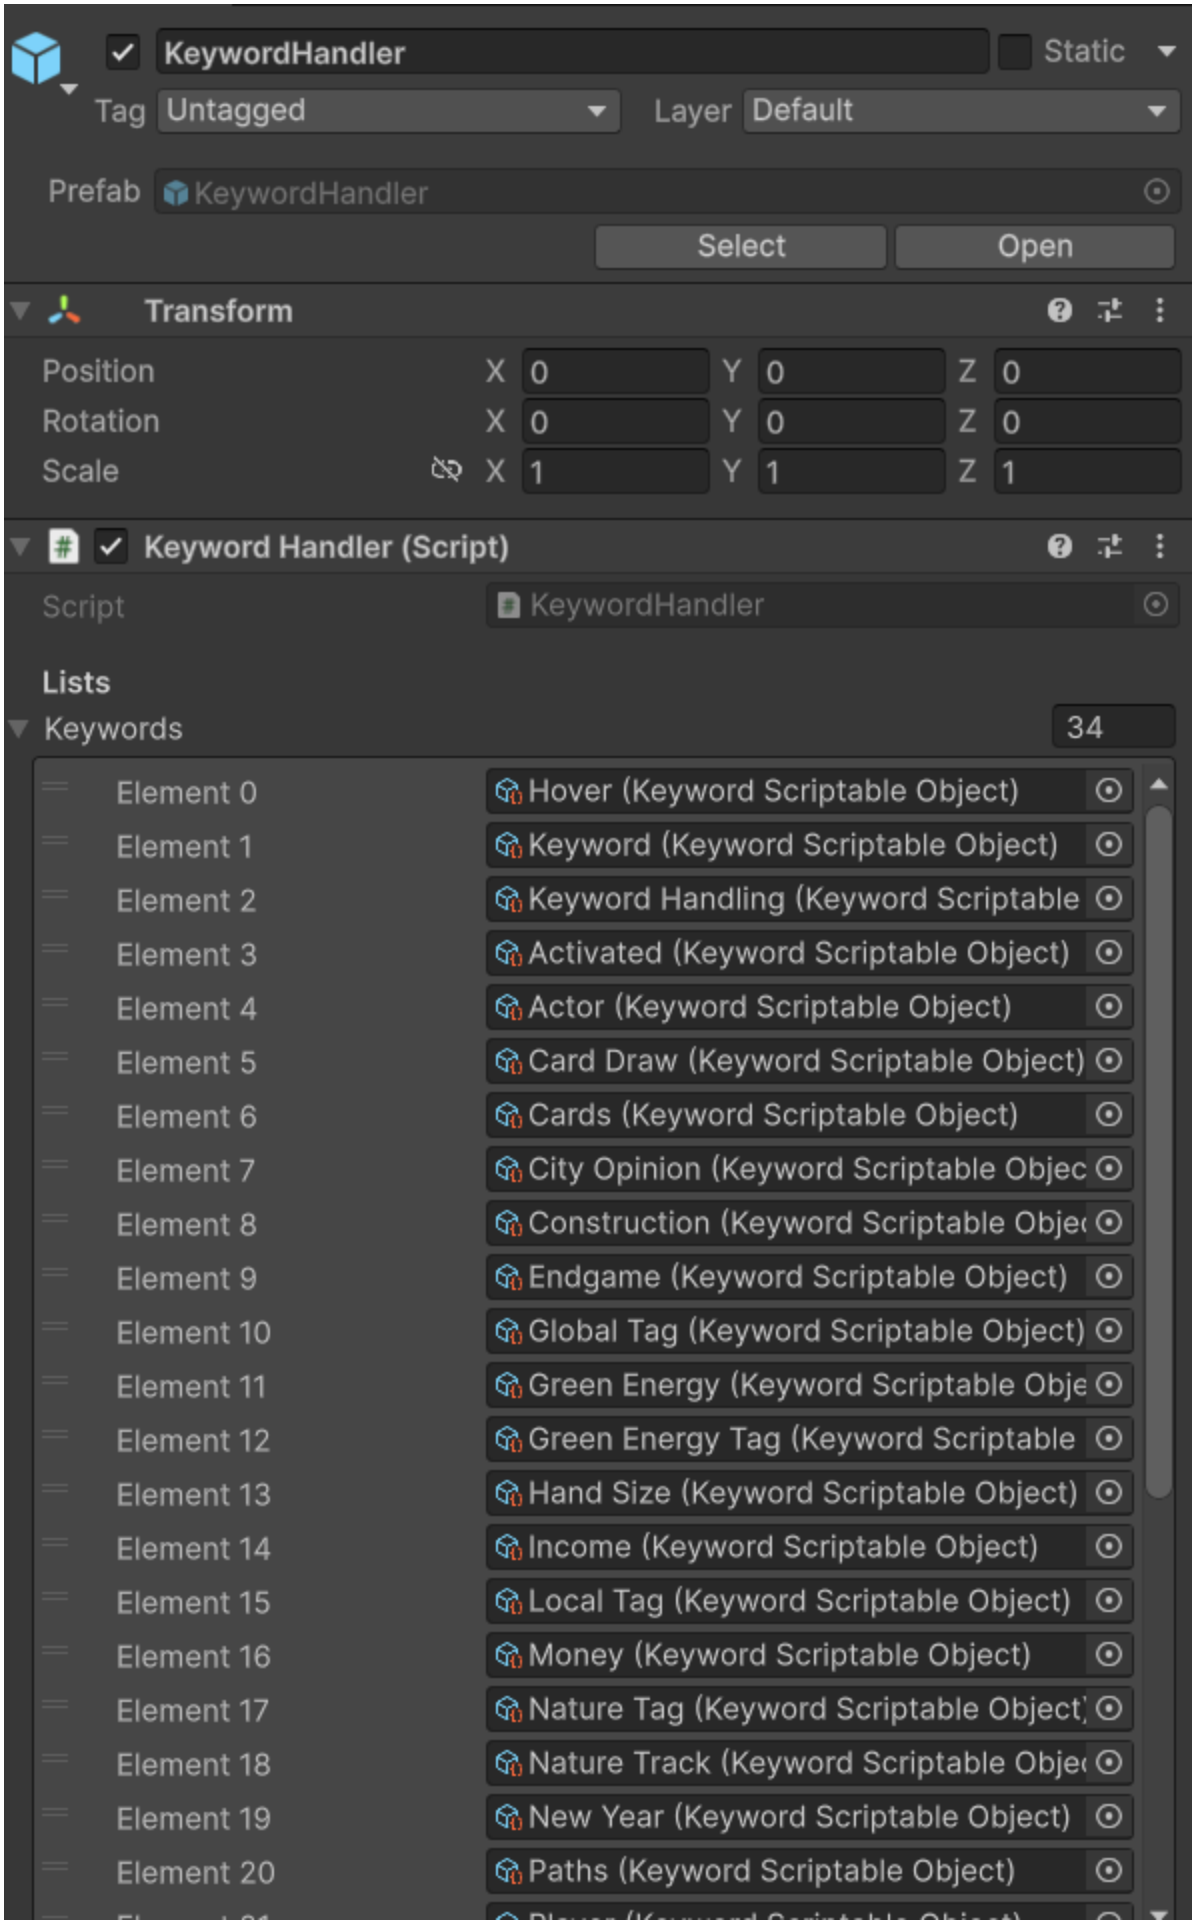

If the icons don't appear, don't forget to set texts Sprite Sheet in extra settings. (More about that later)

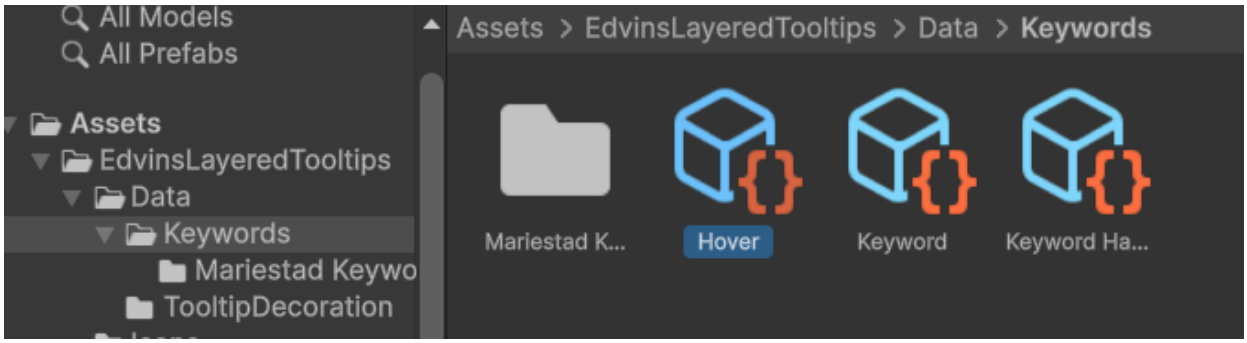

Keywords

The Tooltip Manager Prefab comes with the KeywordHandler Prefab built in. This is the script that holds all the keywords in the game. By default it includes the keywords from the Mariestad Climate Game, though you can of course modify it.

Element 18 Nature Track (Keyword Scriptable Objec
Element 19 New Year (Keyword Scriptable Object)
Element 20 Paths (Keyword Scriptable Object)

Keyword Scriptable Object

The keywords are found in the Data folder of the Asset

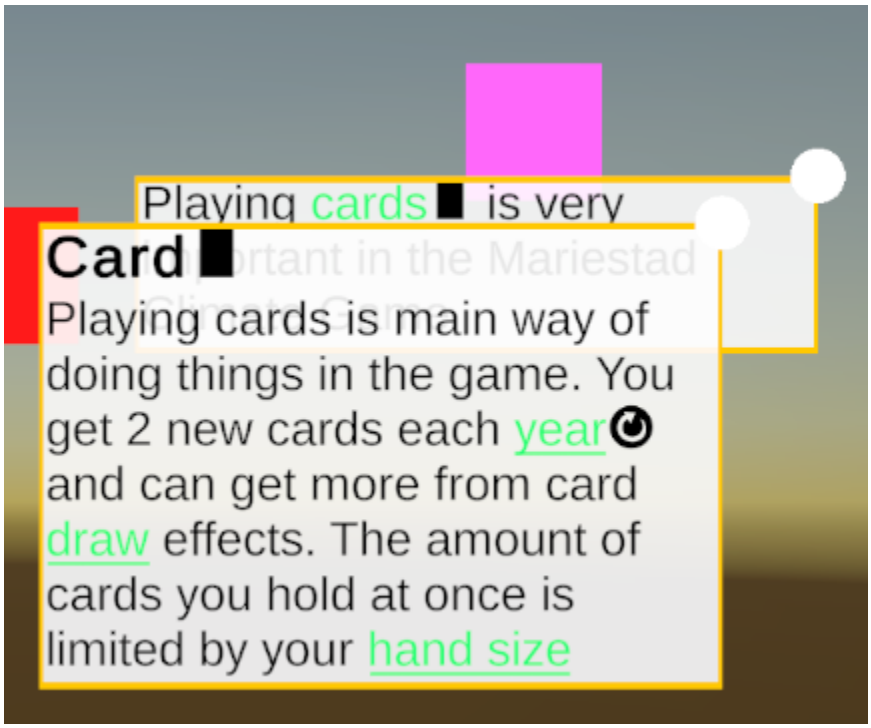

A keyword scriptable object includes its name, type, wordings, icons, tooltip text and specific style.

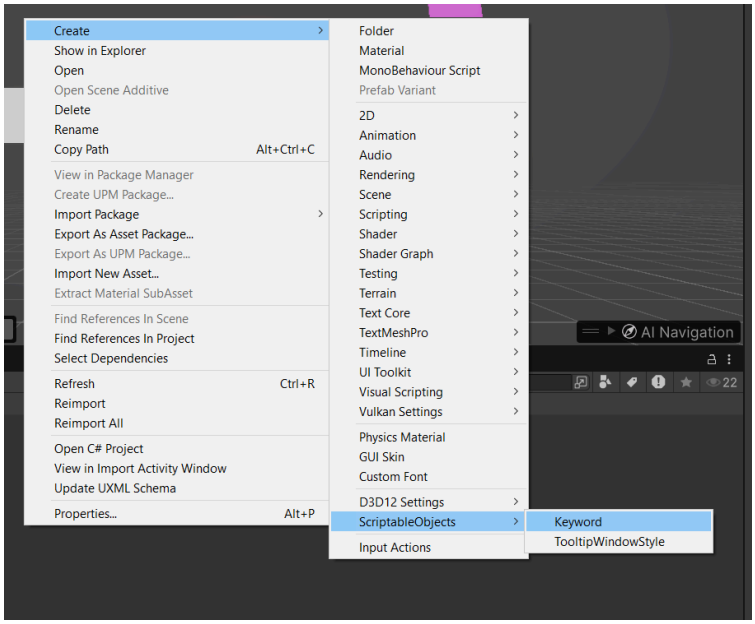

The most important values here are the name, wordings and tooltip text.
Tooltips need to have their own name for the link system to work
However if you want multiple words or phrases to link to the same keyword, you can set that up with the wording system. There are no limits to the amount of wordings a tooltip can have or the

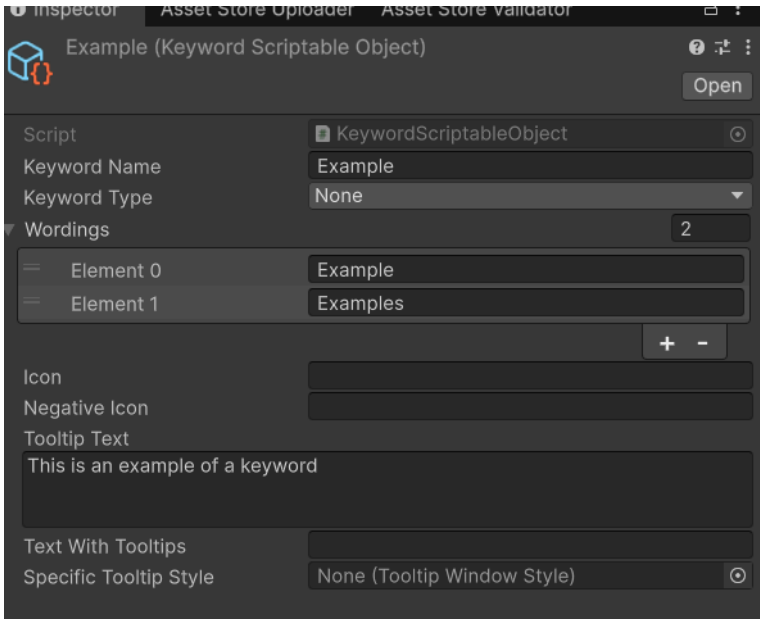

length of a wording. Wordings can't however contain **<angle brackets>** as they used in the TMPro text linking code.
As you can see above the hover tooltip will trigger from the phrases Hover, Hovered, Hovering and Hover over text.
The tooltip text is simply the text that will appear on the tooltip. If the tooltip text contains any wordings from other keywords that part will automatically be bolded, linked and get an icon. This is the core of the Layered Tooltip system.

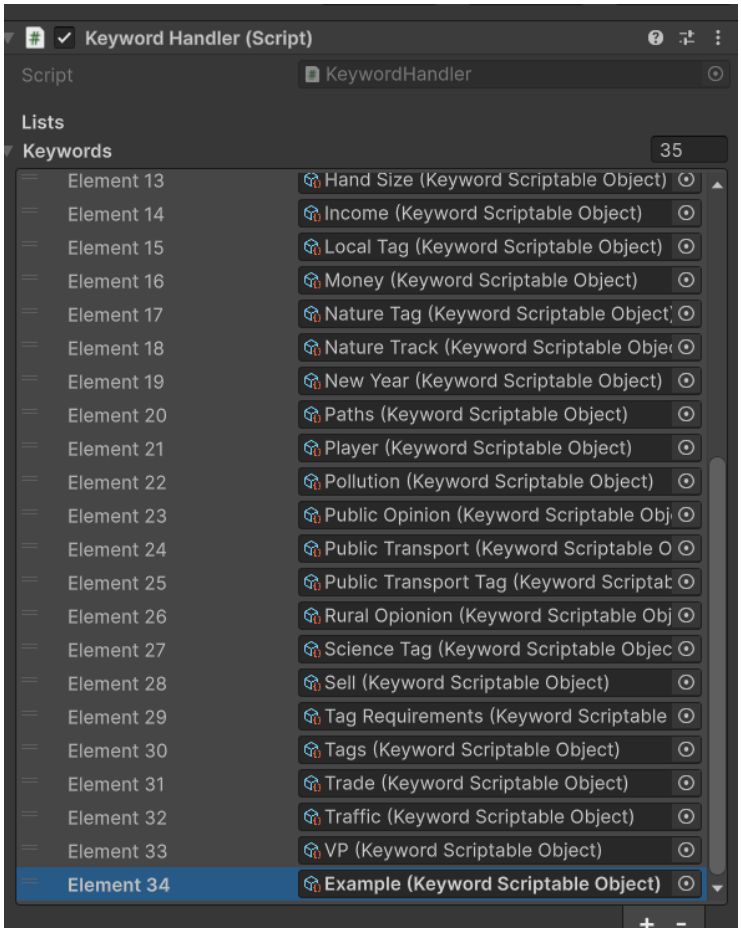

Setting up your own keywords

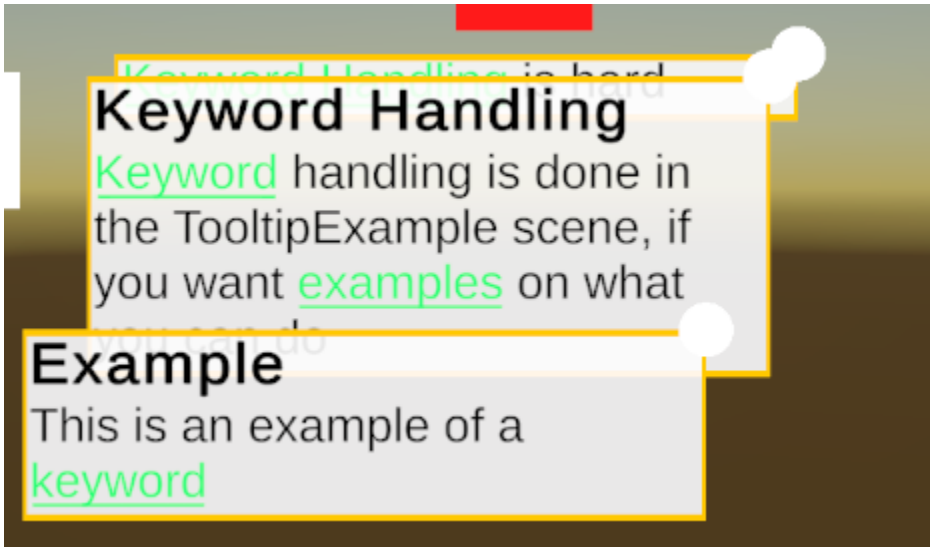

To set up your own keyword you simply need to make a new KeywordScriptableObject

And add that to the keyword handler. Now anytime ‘example’ or ‘examples’ shows up in a text, the keyword will be there.

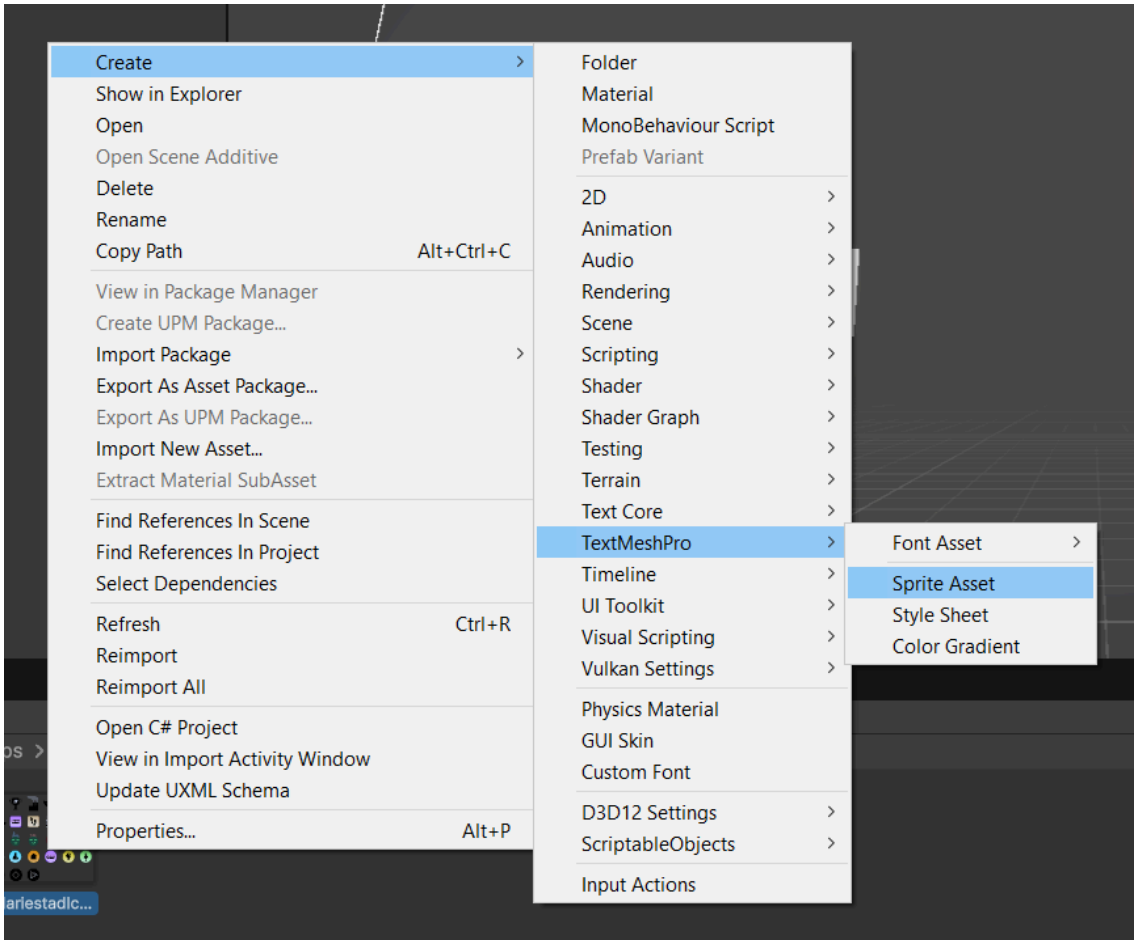

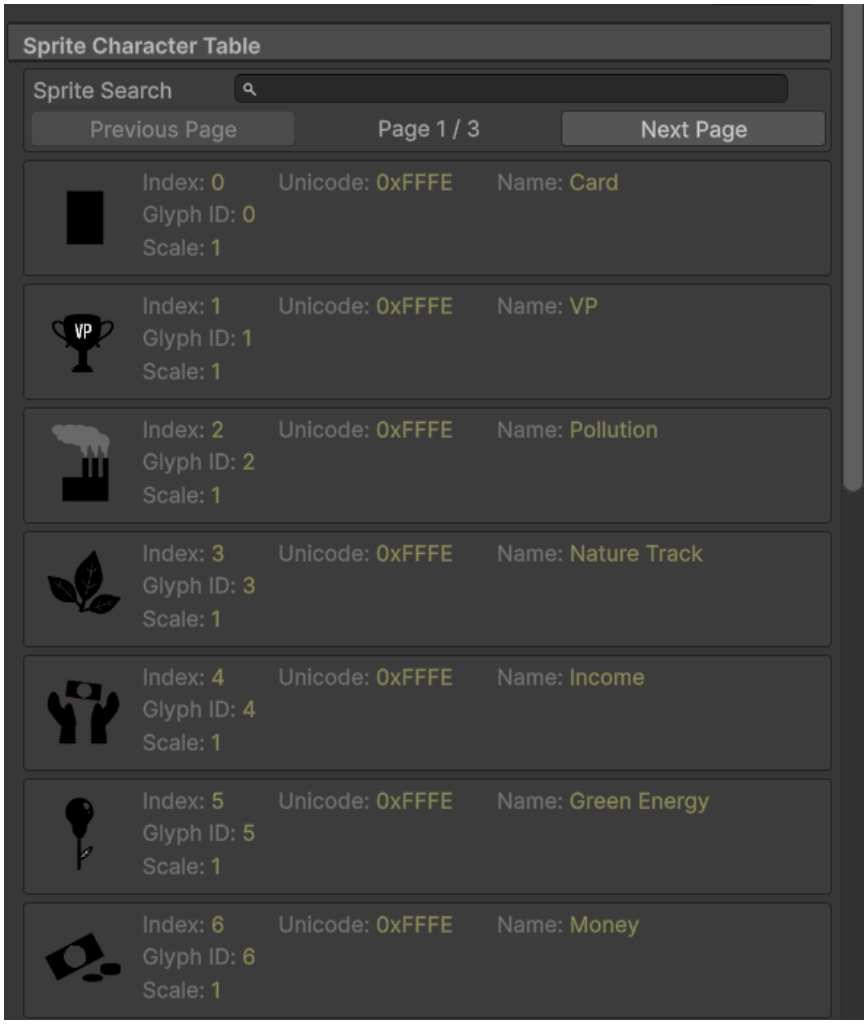

Keyword Icons

Keywords can have icons, little images in text. This is done via the TextMeshProSprite sheet feature. The Mariestad Icon Sheet is provided in asset for example
To create an icon sheet, import an image that contains the icons you want to use in Unity and set it to be a Sprite, to sprite mode Multiple and cut it up in the sprite editor

Then make it into a sprite asset. There are many good tutorials online on making Sprite Assets if you get stuck. Then name every character in your sprite asset. This is a bit annoying but needs to be done, unless you prefer to refer to them by number. After that's done you simply set the icon fields in keywords to the same name as the in the sprite character table and your icons should appear.

Negative Icons

The Asset also supports negative icons, which appear when you have a negative number in front of the icon. The text below becomes the small image attached.
-1 Rural Opinion
+2 City Opinion

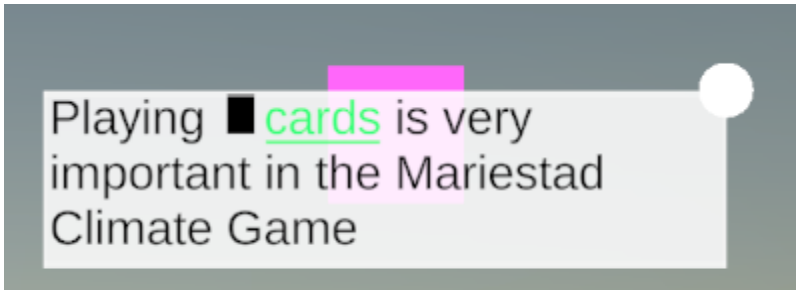

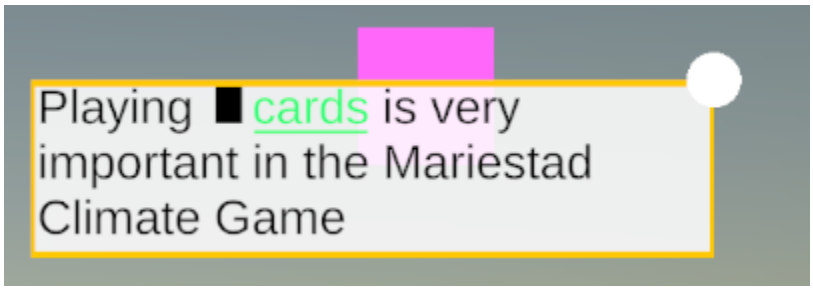

More

Locking Tooltips

You can lock open tooltips, making them not disappear when you leave their area with the mouse.
This is normally done with the middle mouse button, but the button can be specified in the TooltipManager.
Locked tooltips have a more defined border, which can be set in appearance in the tooltip style

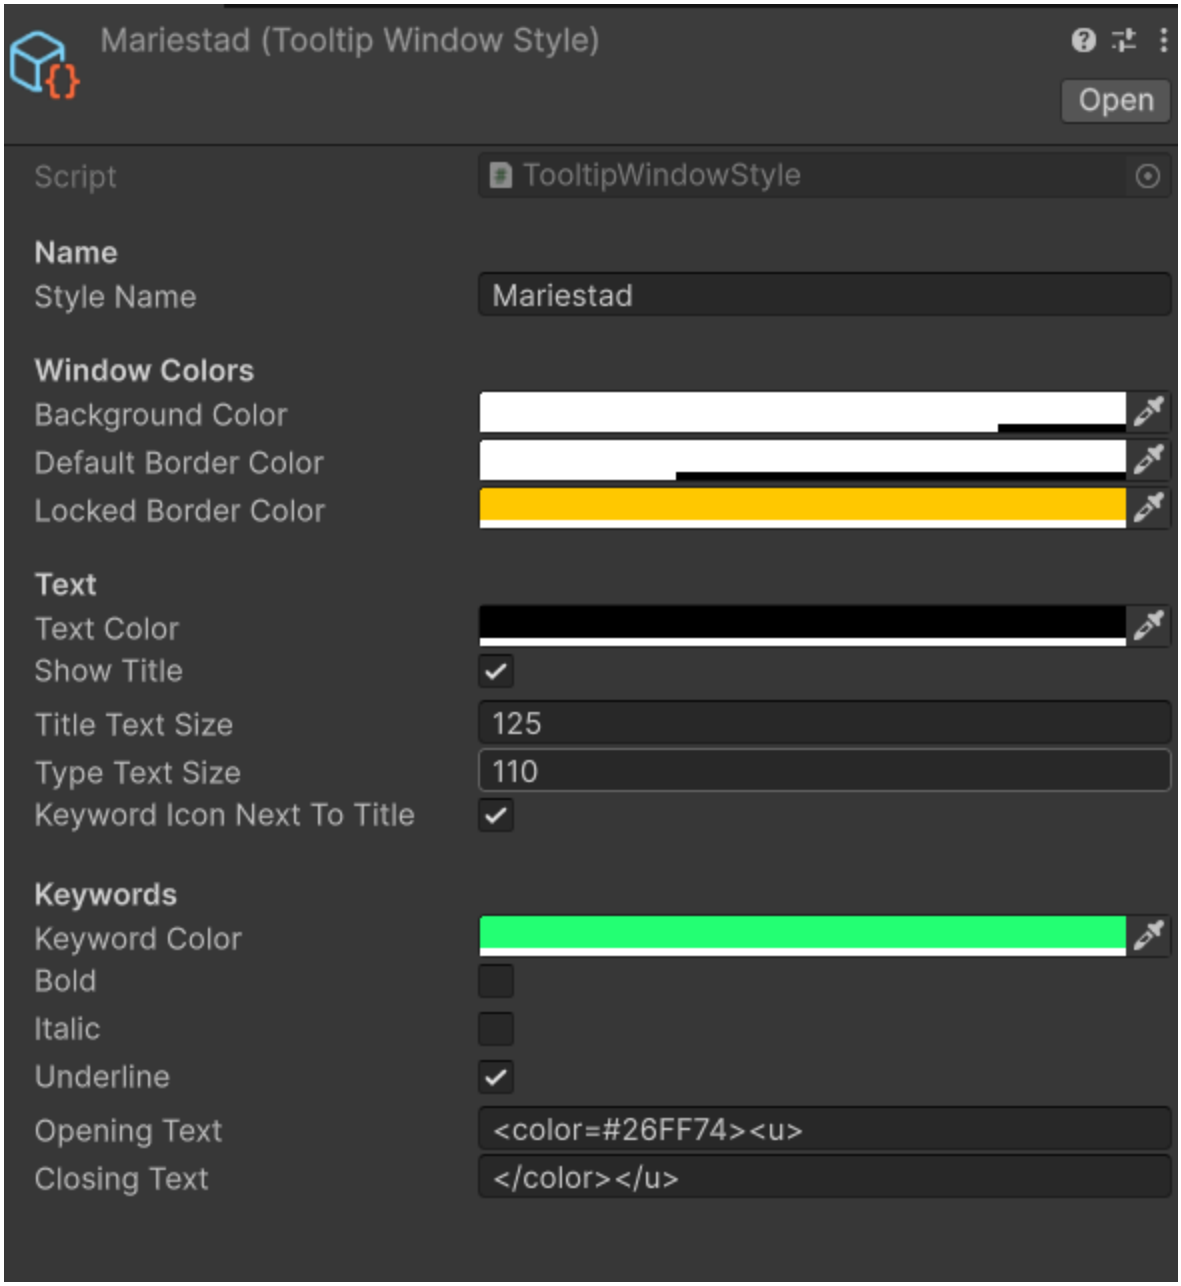

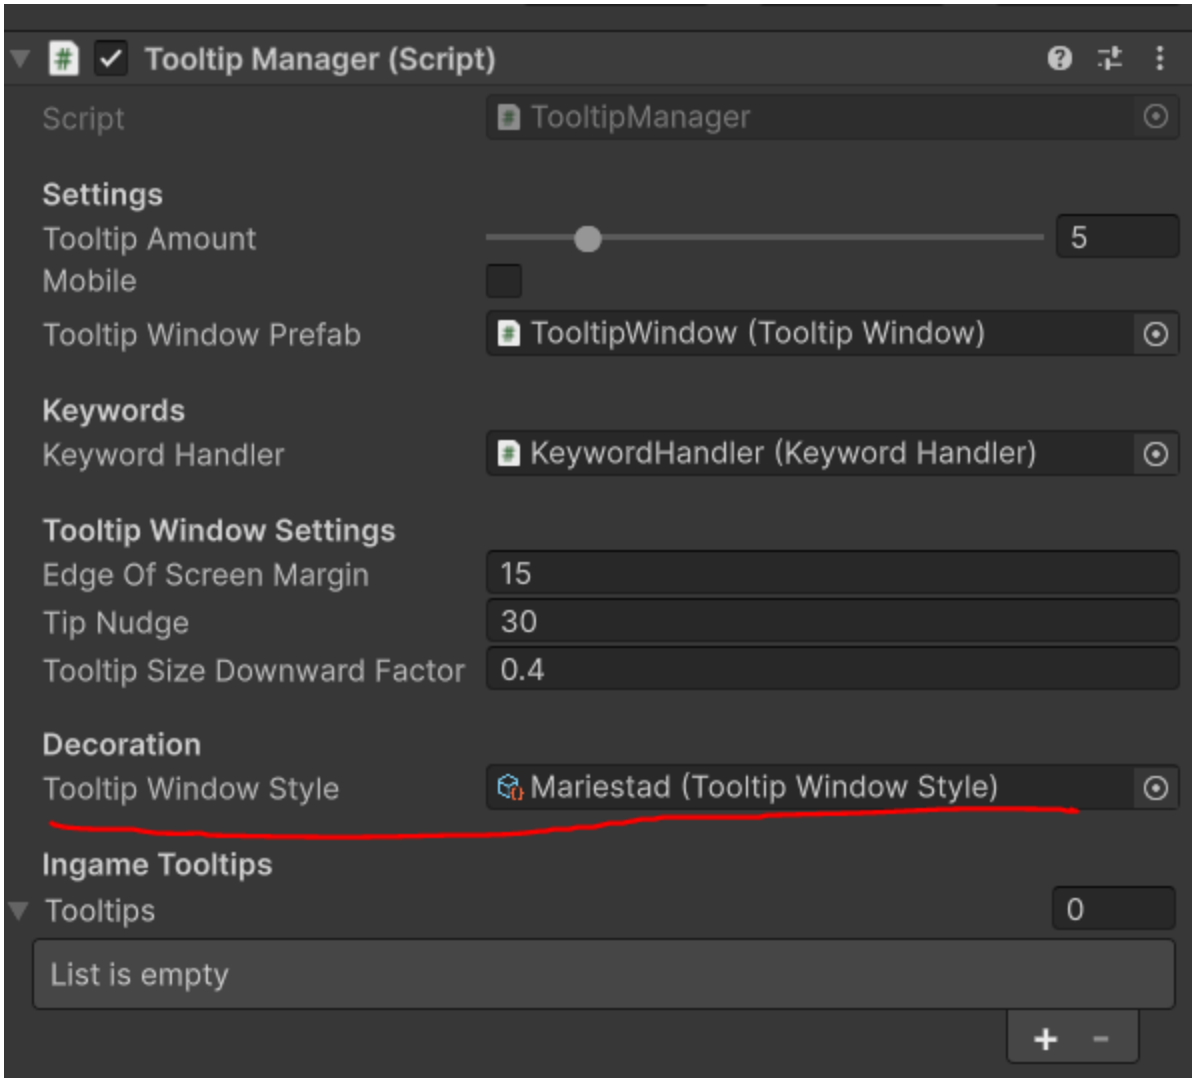

The Tooltip Circle

The circle on the right upper corner closes the tooltip. You shouldn't get them stuck but this is here in case you do.

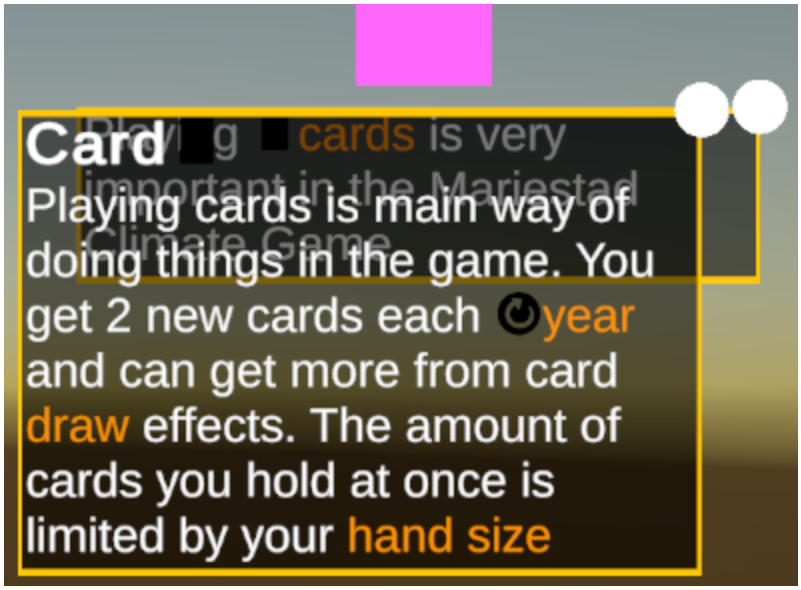

Tooltip Styles

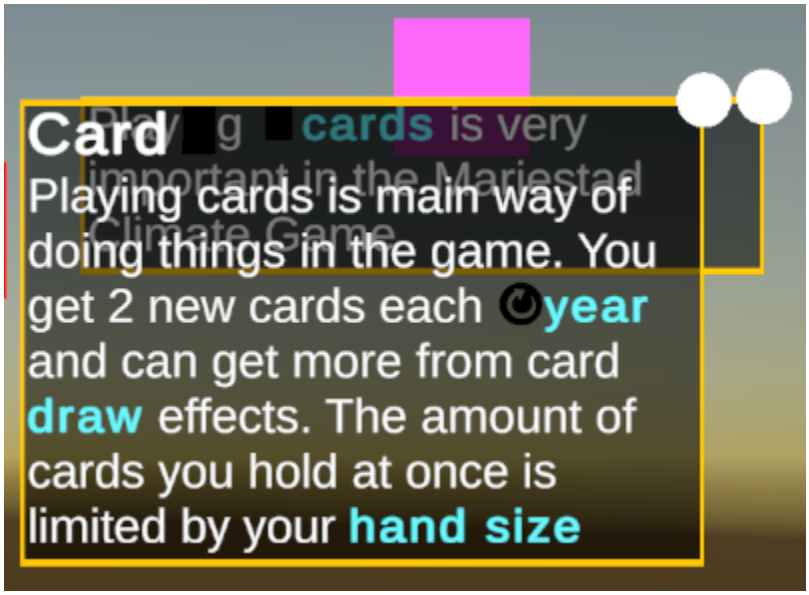

Should you wish to change the appearance of the tooltips there is the TooltipWindowStyle scriptableObject with 7 tooltip styles, and the ability to make more. You can customize the color of the background, the border, the text and the color and style of keywords in text. You can also customize whether the title of a keyword should show up and how large the title should be. If you want to switch tooltip style you do that by simply swapping the scriptableObject in the TooltipManager. There is also the option of having a unique tooltip style for a specific tooltip or keyword.
