Setup

Tooltip Manager

To set up tooltips you need to first install TMPro if you haven't (though if you are working with UI's you probably have). Then simply need to add the tooltipManager prefab to the scene as a child of the main Canvas in the scene.
If your tooltip manager's transform (position, rotation, scale) values get set to anything the default simply revert the changes so its at position 0, 0, 0, at rotation 0, 0, 0 and at scale 1, 1, 1

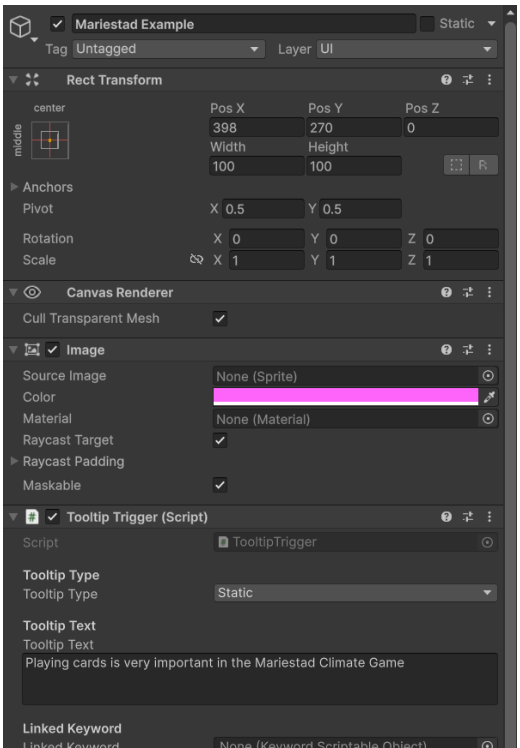

I tend to use my canvas at Scale With Screen Size, but it works at Constant Pixel Size too

It will come preset with default settings, though you can change settings in the inspector fields if you want.

UI Tooltip

After doing that you can add the tooltip trigger object to any UI object. The object needs to have raycast target set to be enabled, and there can't be an object above it in UI blocking the raycast

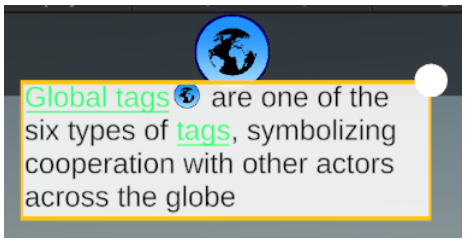

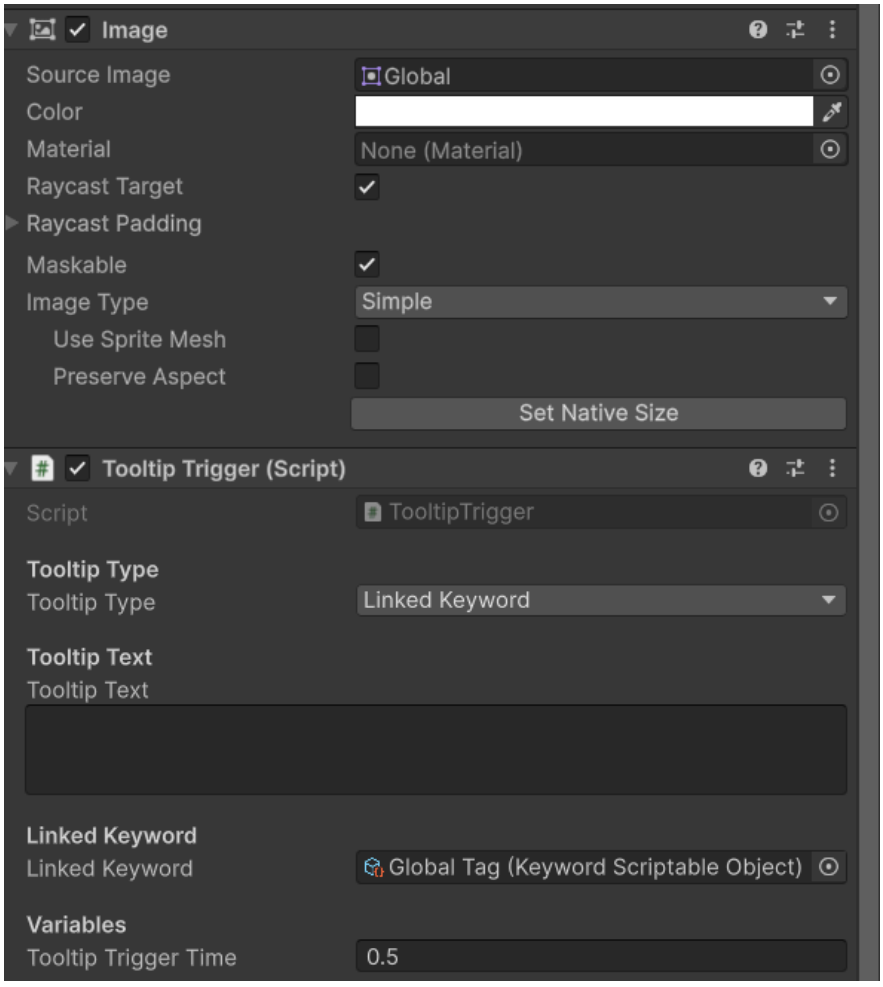

This should create a tooltip like this

Linked Keyword Tooltip

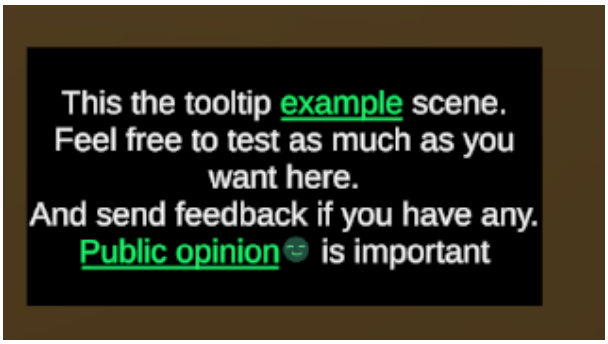

Another tooltip type is the linked keyword tooltip. These display the tooltip text of a keyword, making them update automatically if you update the keyword scriptable object.

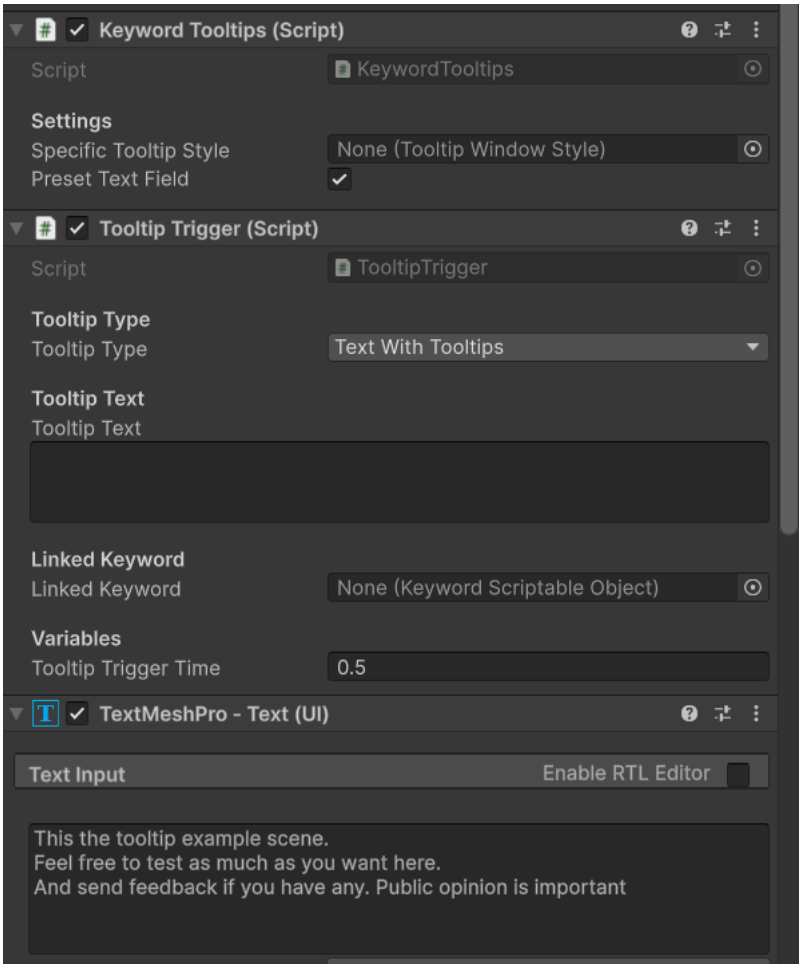

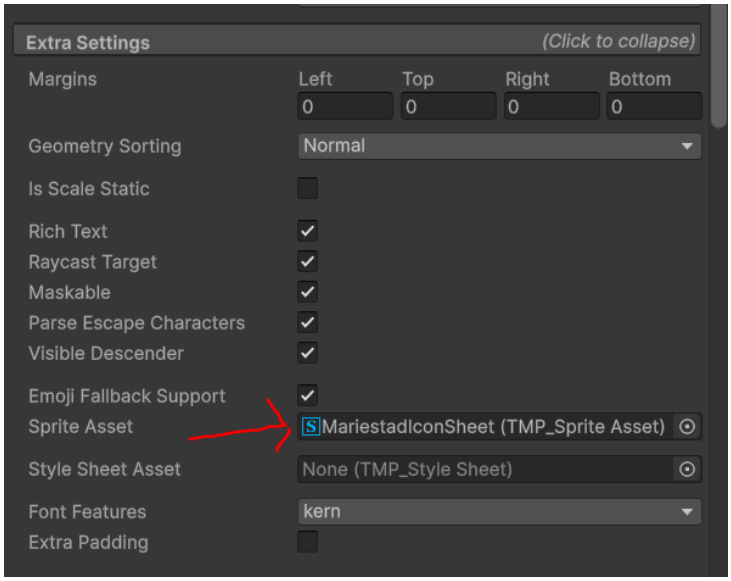

Text With Tooltips

Finally there is the Text With Tooltips type, for if you want tooltips by keywords in one of your texts. These work using linked words, in the same way tooltips works. To do so, set up a TextMeshPro Text UI object, add the Keyword Tooltip and Tooltip Trigger scripts, and set the latter to the type Text With Tooltips. If the text field at the start is the text you want to display, set Preset Text Field to true. If the text inside will be changing in game, you can call the AddKeywordsToText function on the KeywordTooltips script to update the text

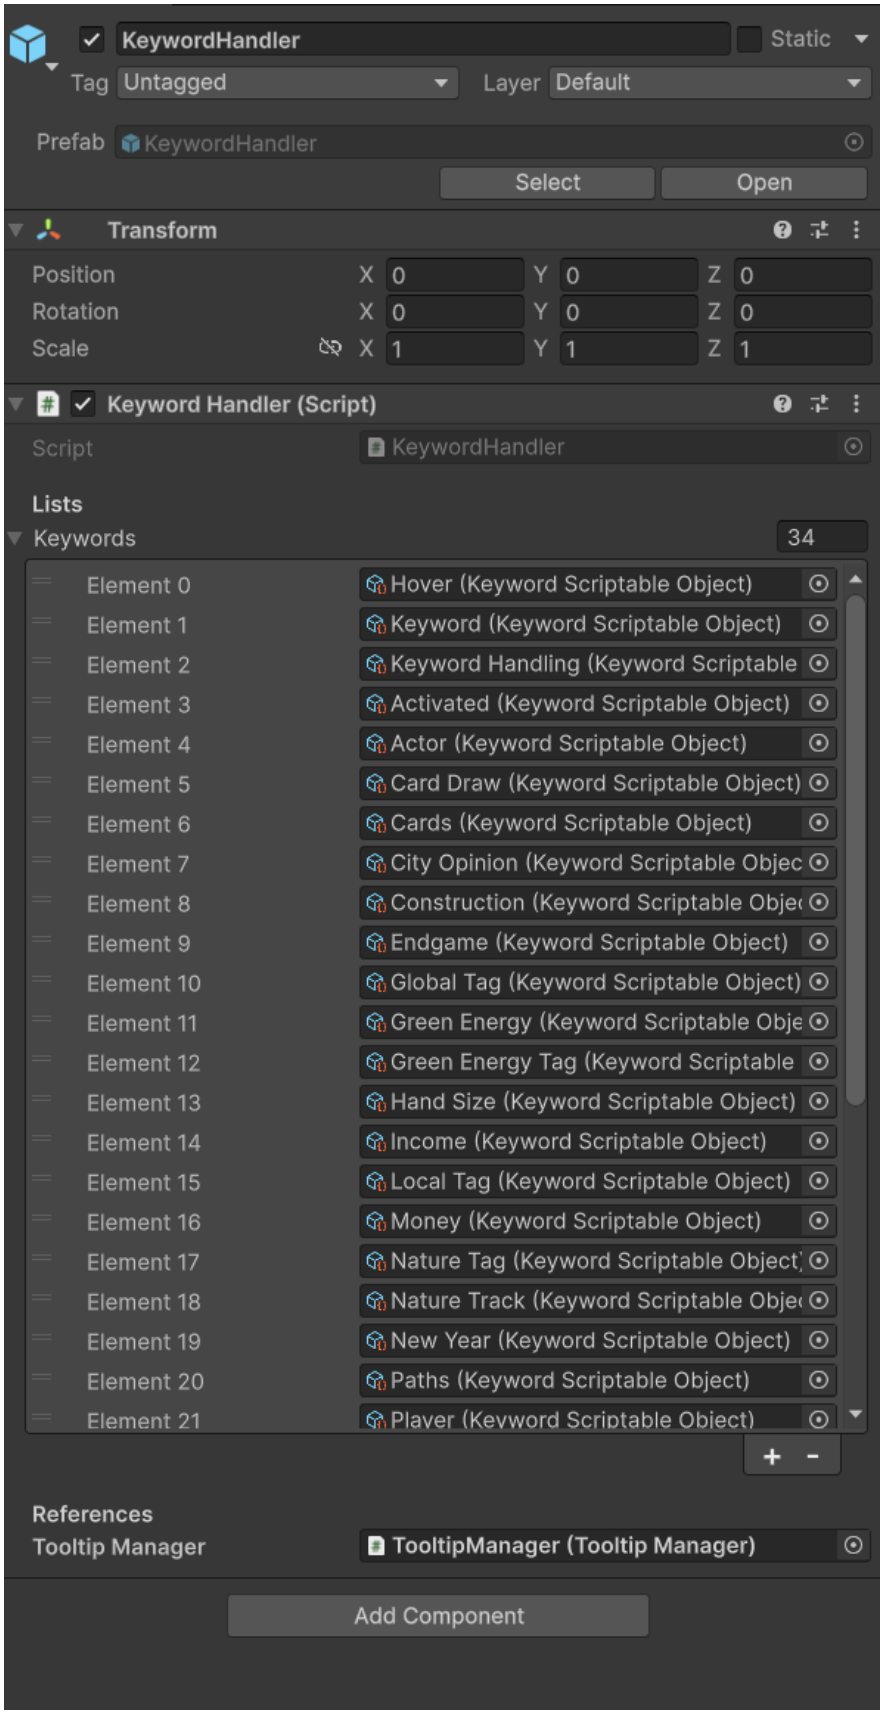

If the icons don’t appear, don’t forget to set texts Sprite Sheet in extra settings. (More about that later)

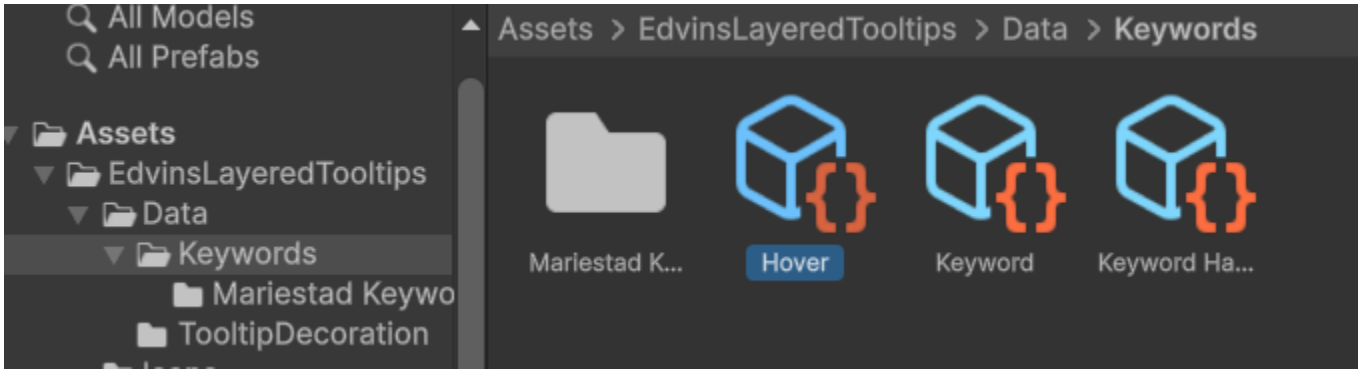

Keywords

The Tooltip Manager Prefab comes with the KeywordHandler Prefab built in. This is the script that holds all the keywords in the game. By default it includes the keywords from the Mariestad Climate Game, though you can of course modify it.

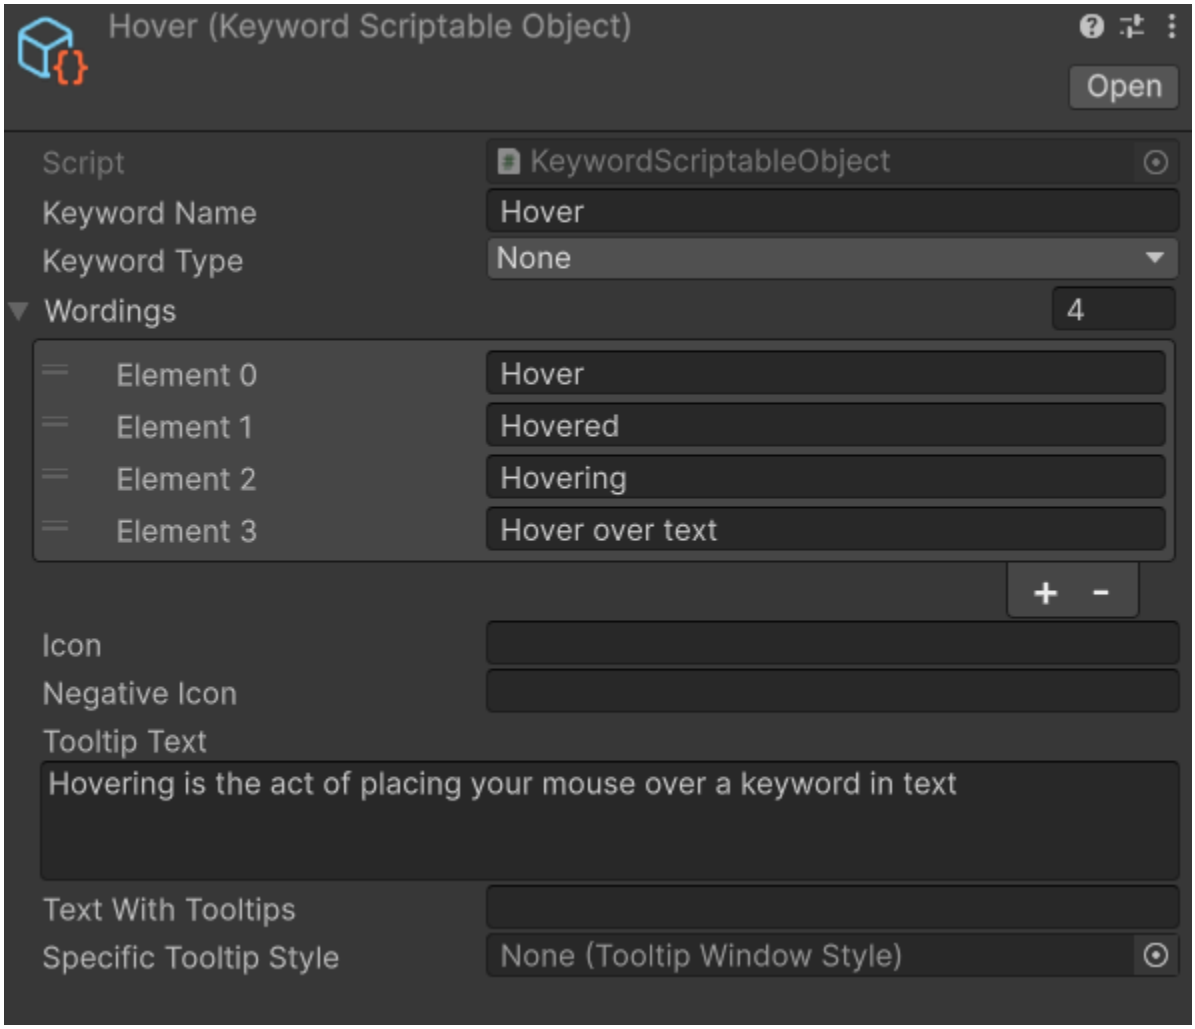

Keyword Scriptable Object

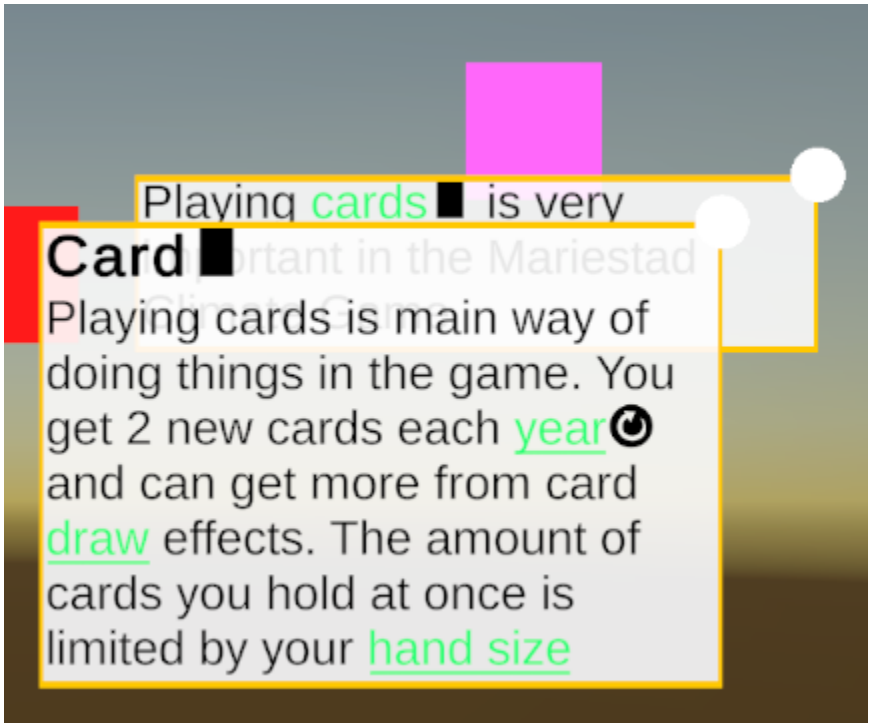

The keywords are found in the Data folder of the Asset

A keyword scriptable object includes its name, type, wordings, icons, tooltip text and specific style.

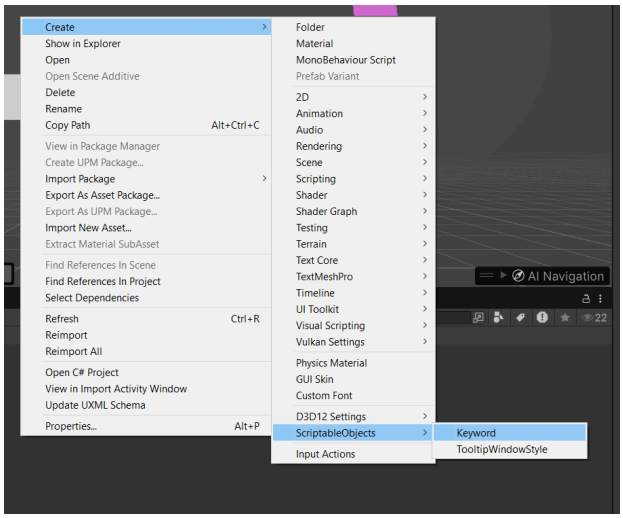

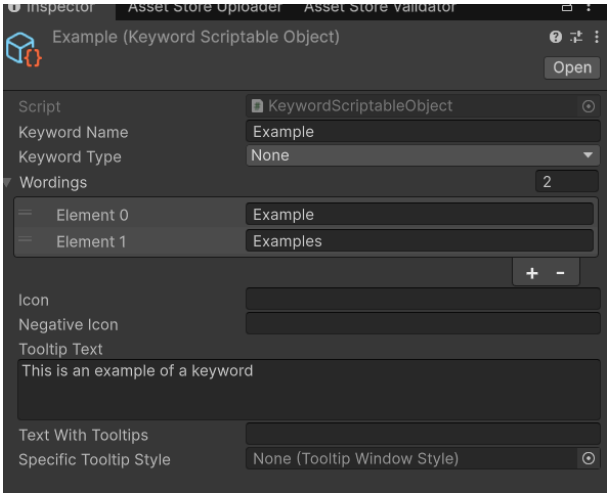

The most important values here are the name, wordings and tooltip text.
Tooltips need to have their own name for the link system to work
However if you want multiple words or phrases to link to the same keyword, you can set that up with the wording system. There are no limits to the amount of wordings a tooltip can have or the length of a wording. Wordings can't however contain **<angle brackets>** as they are used in the TMPro text linking formatting.
For an example, the hover tooltip above will trigger from the phrases Hover, Hovered, Hovering and Hover over text.
The tooltip text is simply the text that will appear on the tooltip. If the tooltip text contains any wordings from other keywords that part will automatically be bolded, linked and get an icon. This is the core of the Nested Tooltip system.

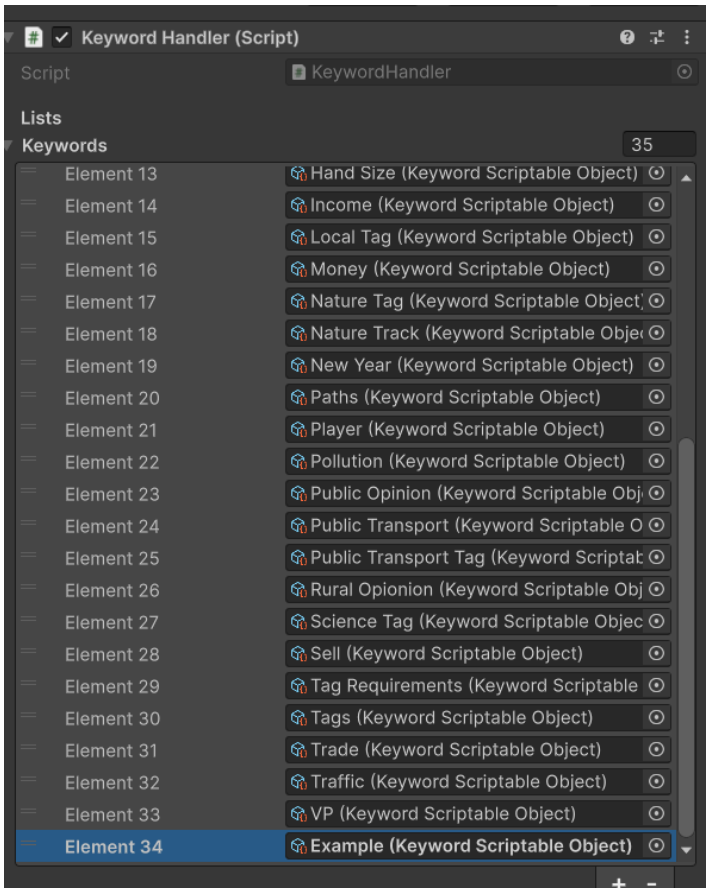

Setting up your own keywords

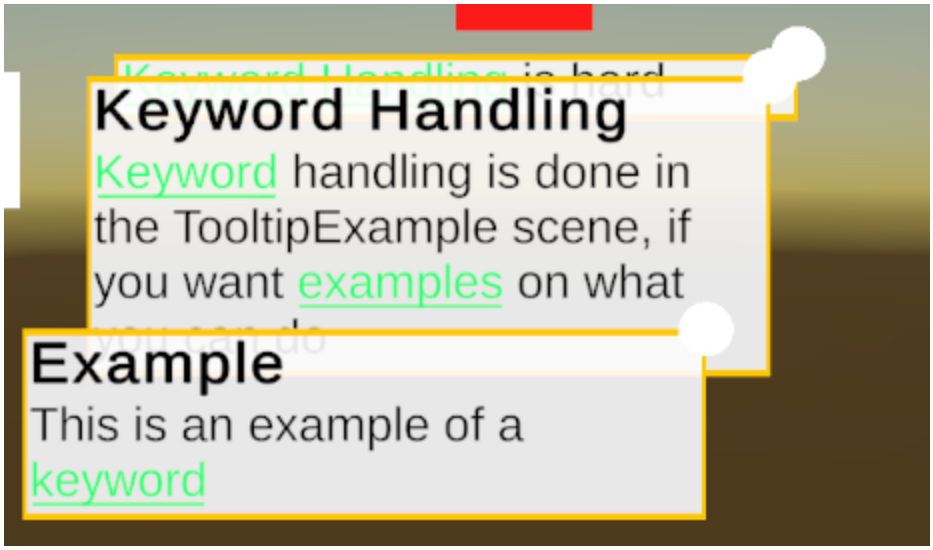

To set up your own keyword you simply need to make a new KeywordScriptableObject

And add that to the keyword handler. Now anytime ‘example’ or ‘examples’ shows up in a text, the keyword will be there.

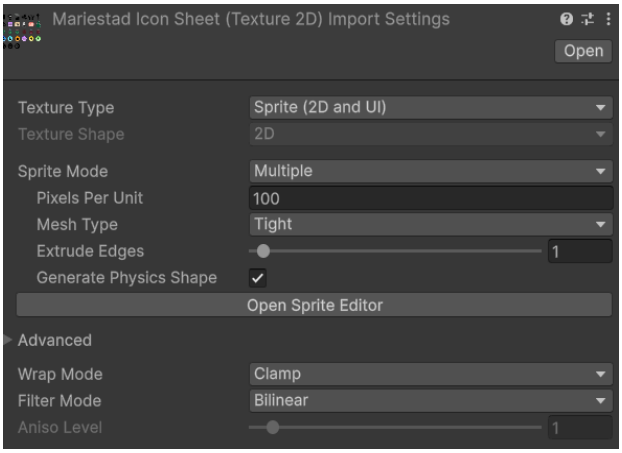

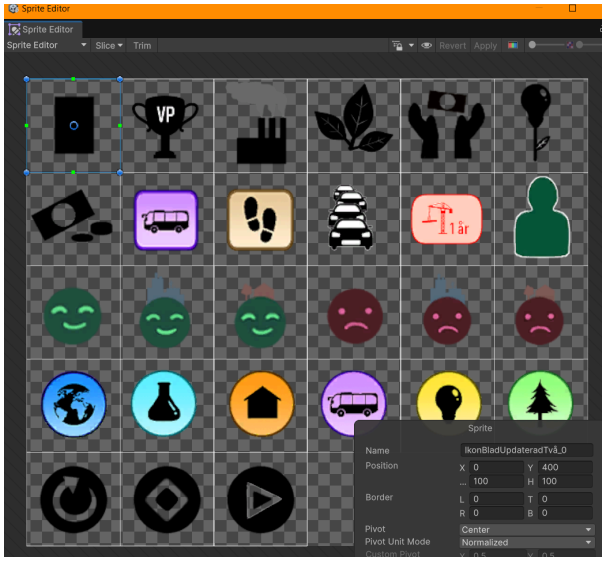

To handle your keywords I recommend storing the data in a google sheet or other database. You can either update your scriptable objects manually or set up an editor script to update them from CSV files or similar. (As seen here you can you can use wordings to use keywords for multiple languages)

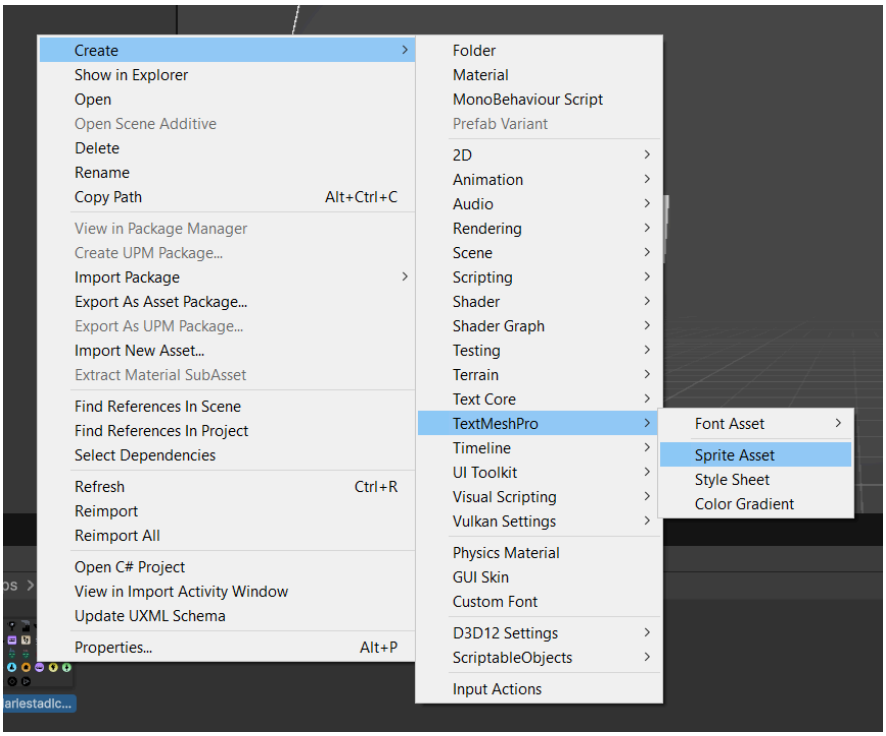

Name	Wordings 1	Wording 2	Wording 3+	Icons	Negative	Tooltip
Activated	Activated	Aktiverad		Activated		Activated effects trigger whenever the specfied trigger happens.
Actor	Actor	Aktör				The actor card is the faction you play as. It sets your start money and income, gives you a positive effect and often comes with
Card Draw	Dra	Draw				Card draw effect allow you to draw new cards
Cards	Cards	Card	kort	Card		Playing cards is main way of doing things in the game. You get 2 new cards each year and can get more from card draw effect
City Opinion	City Opinion	Stadsåsikt		Positive City	Negative City	City opinion is one of the two opinion tracks alongside rural opinion
Construction	Construction	Konstruktion	Constructions	Construction		Cards with construction take a year to build and produce effects
Endgame	End	Slutet		Endgame		Endgame effects provide VP at the end of the game
Global Tag	Global Tag	Global Tags	globaltagg, globaltaggar	Global Tag		Global tags are one of the six types of tags, symbolizing cooperation with other actors across the globe
Green Energy	Green Energy	Grön Energi		Green Energy		Producing green energy reduces pollution and other benefits along the green energy track
Green Energy Tag	Green Energy Tag	Green Energy Tags	grönenergitagg, grönen	Green Energy Tag		Green energy tags are one of the six types of tags, symbolizing production and development of in green energy
Hand Size	Hand Size	handstorlek				Your hand size limits how many cards you can have in your hand. If you have more than that amount of cards you need to disc
Income	Income	Inkomst		Income		Every new year you gain money equal to your income. Increasing your income early is a great strategy
Local Tag	Local Tag	Local Tags	lokaltagg, lokaltaggar	Local Tag		Local tags are the most common of the six types of tags, symbolizing local development and cooperation with the people of Ma
Money	Money	Pengar		Money		Money is used to play cards based on their cost. You get money each year based on your income
Nature Tag	Nature Tag	Nature Tags	naturtagg, naturtaggar	Nature Tag		Nature tags are one of the six types of tags, symbolizing protection and development of nature and green areas
Nature Track	Nature Track	naturmätaren	naturmätare	Nature Track		The Nature Track increases when you build nature and greenery. When it reaches 3 you reduce pollution and goes back to zero
New Year	Year	År		New Year		At the start of the new year you draw 2 cards, gain money equal to income and complete constructions from last year
Paths	Paths	Path	gångväg, gångvägar	Paths		Building public transport and paths reduces pollution and gives cards
Player	Player	Spelare	Antal	Player		

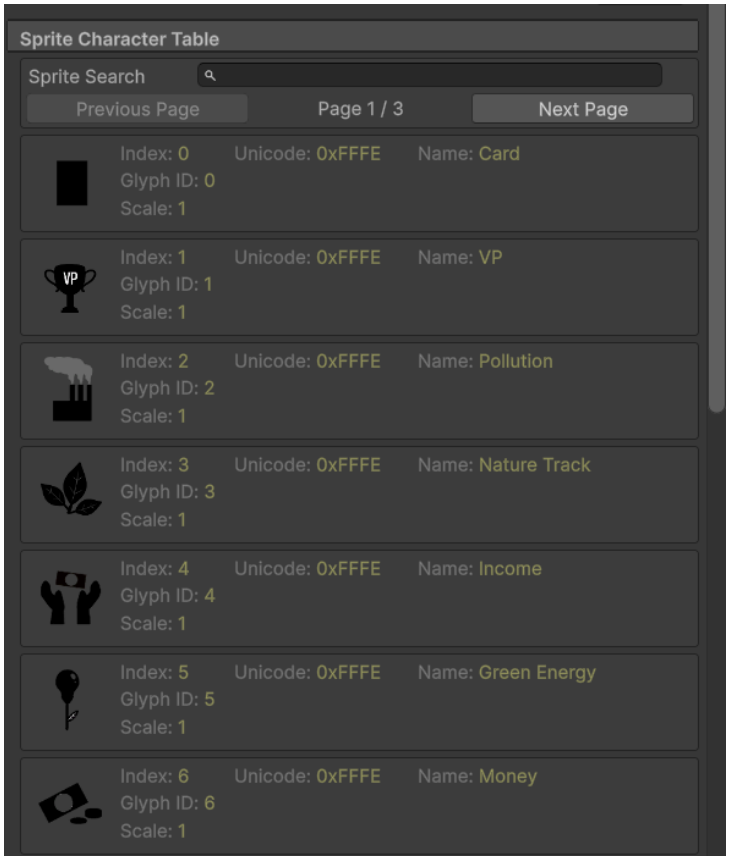

Keyword Icons

Keywords can have icons, little images in text. This is done via the TextMeshProSprite sheet feature. The Mariestad Icon Sheet is provided in the icons folder for example
To create an icon sheet, import an image that contains the icons you want to use in Unity and set it to be a Sprite, set its to sprite mode to Multiple and cut it up in the sprite editor

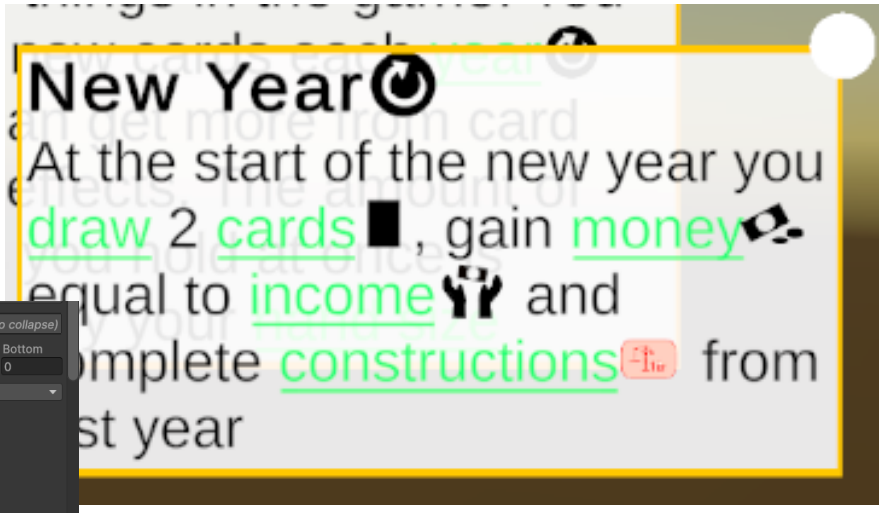

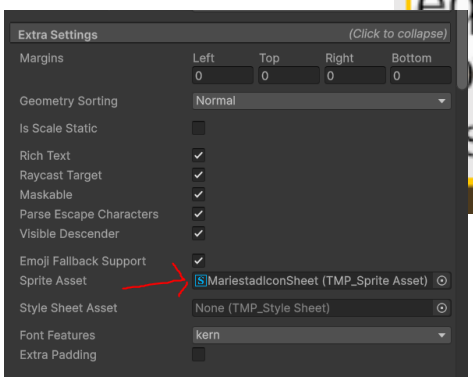

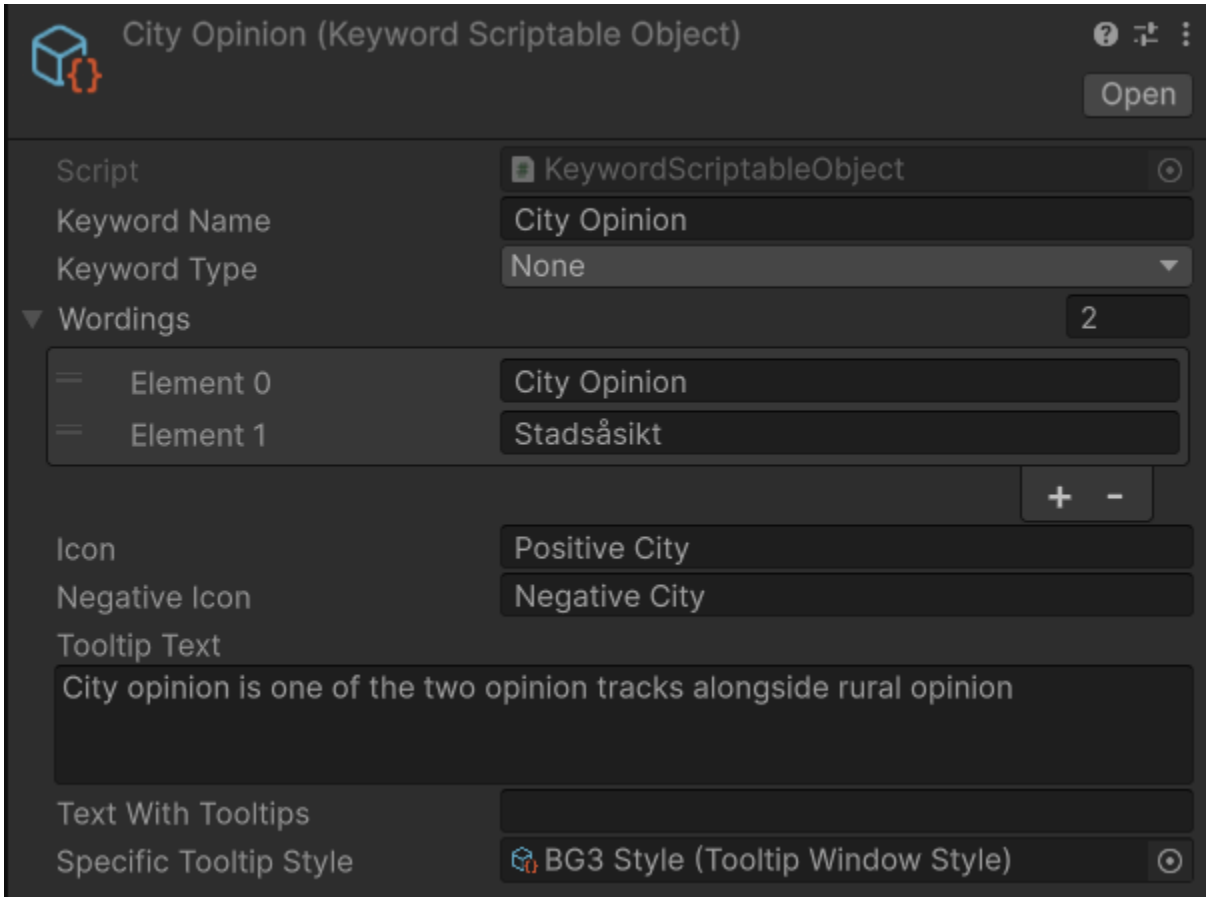

Then make it into a sprite asset. There are many good tutorials online on making Sprite Assets if you get stuck. Then name every character in your sprite asset. This is a bit annoying but needs to be done, unless you prefer to refer to them by number in your keywords. After that's done you simply set the icon fields in keywords to the same name as the in the sprite character table and your icons should appear.

Negative Icons

The Asset also supports negative icons, which appear when you have a negative number in front of the icon. The text below becomes the small image attached.
-1 Rural Opinion
+2 City Opinion

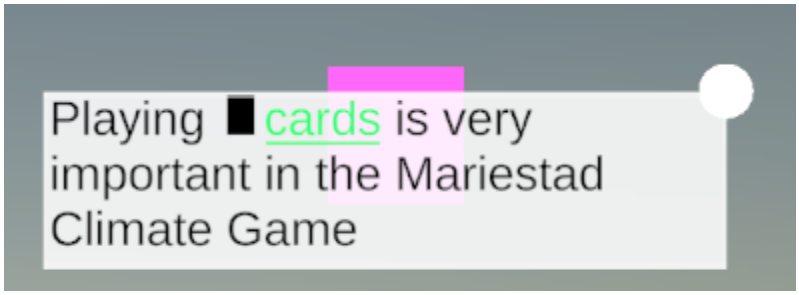

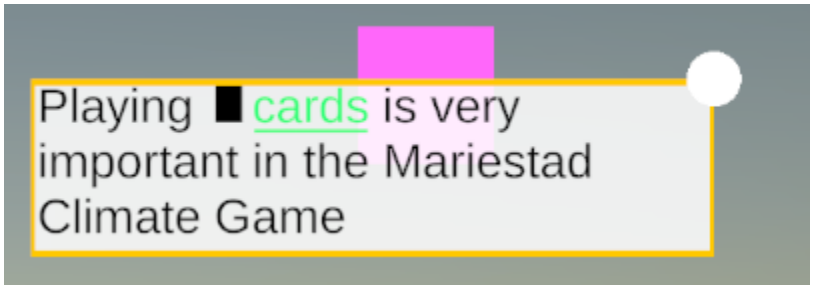

More

Locking Tooltips

You can lock open tooltips, making them not disappear when you leave their area with the mouse.
This is normally done with the middle mouse button, but the button can be specified in the TooltipManager.
Locked tooltips have a more defined border, which can be set in appearance in the tooltip style

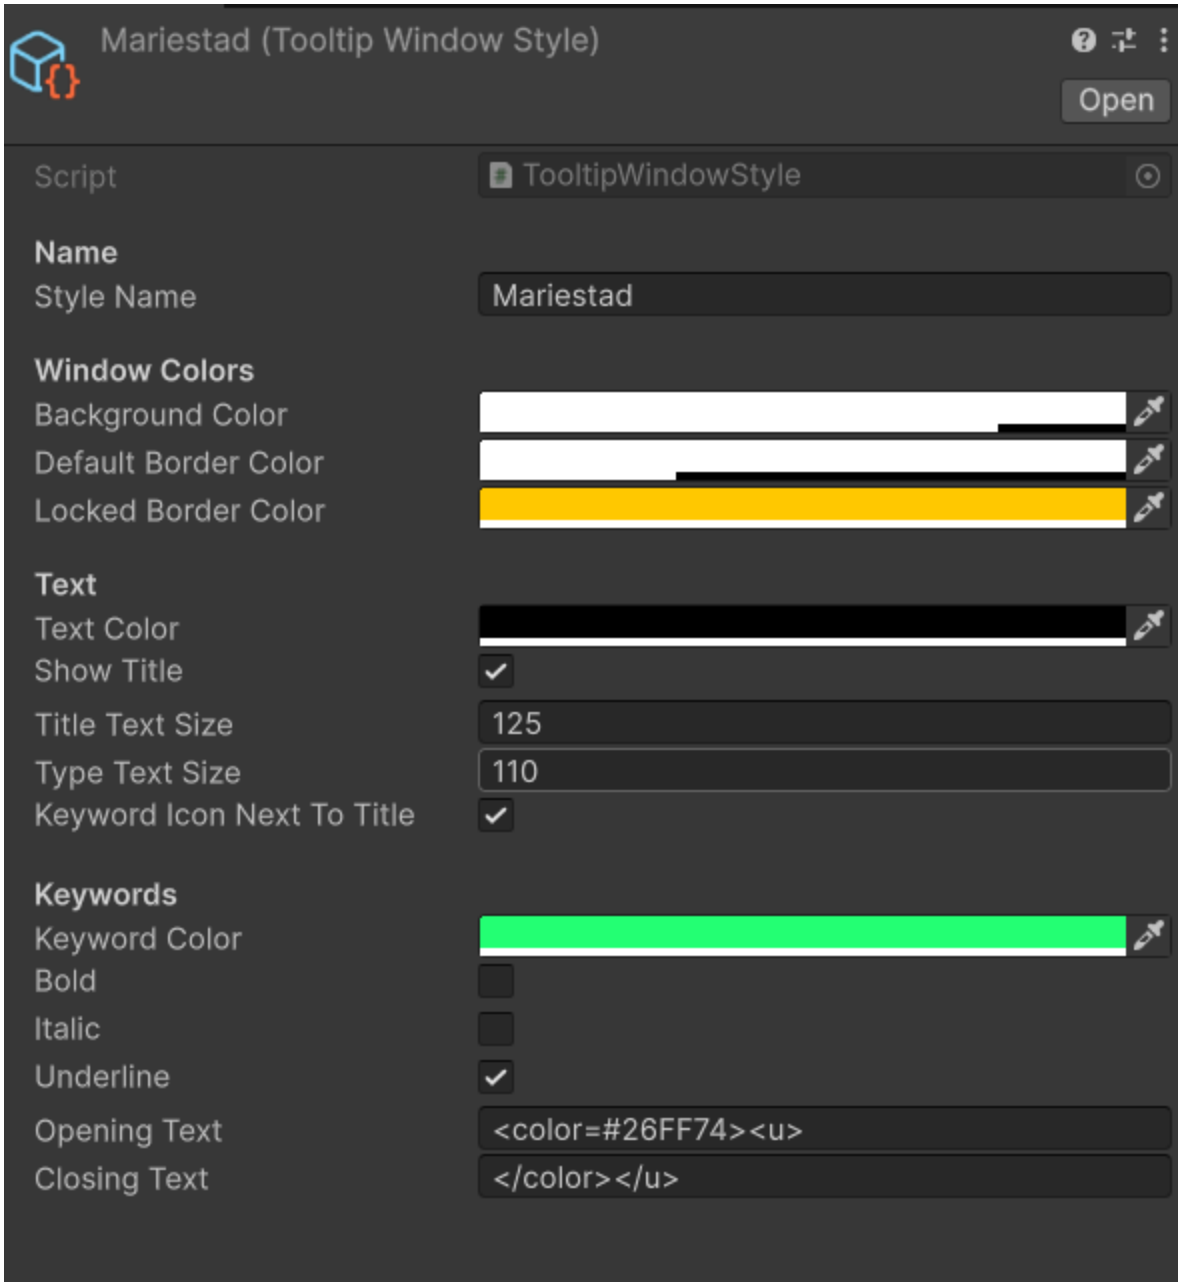

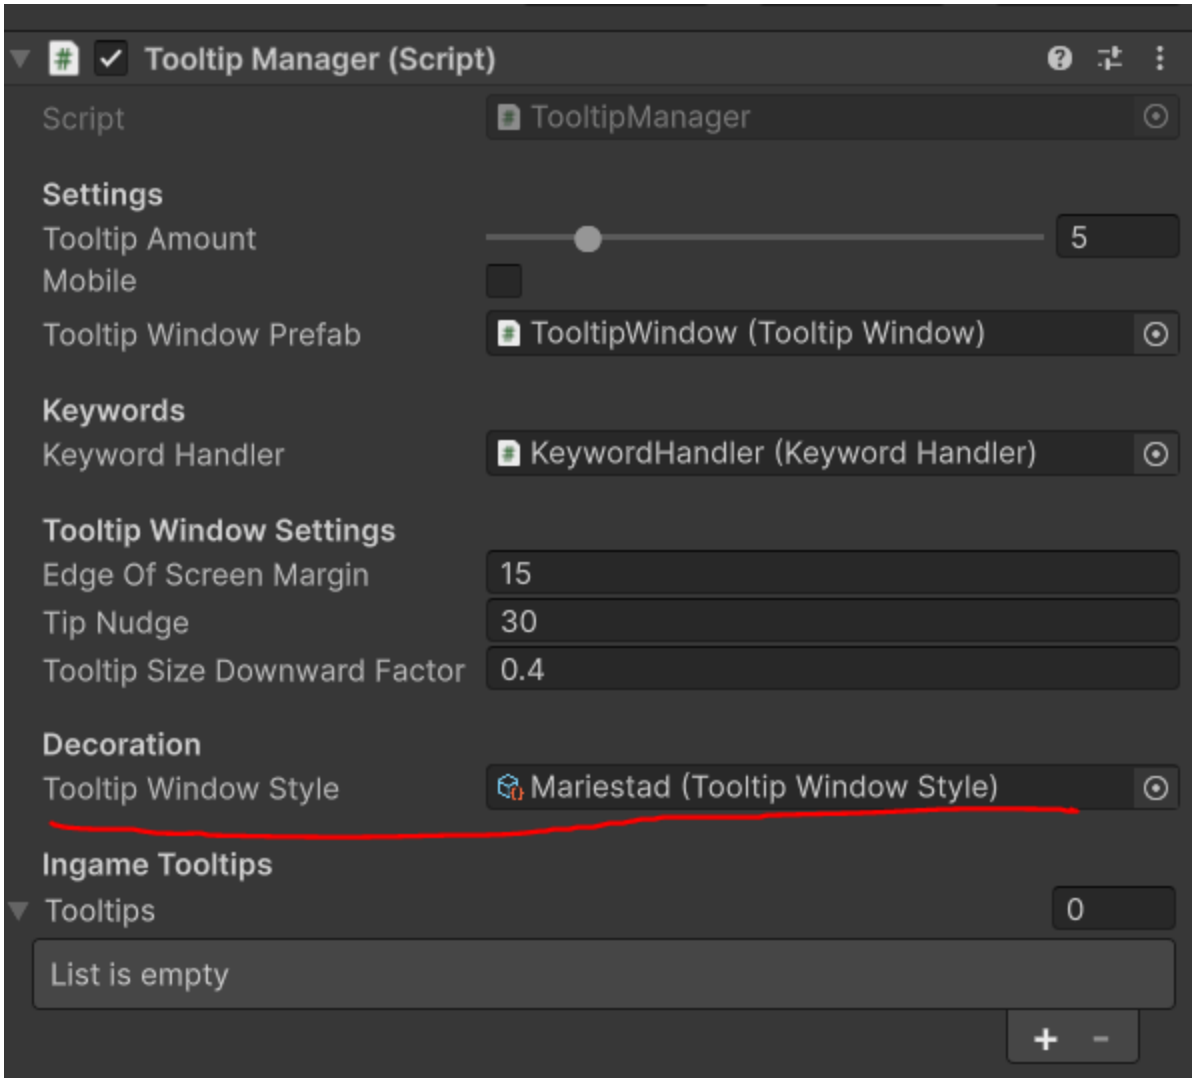

The Tooltip Circle

The circle on the right upper corner closes the tooltip. You shouldn't get them stuck but this is here in case you do.

Tooltip Styles

Should you wish to change the appearance of the tooltips there is the TooltipWindowStyle scriptableObject with 7 tooltip styles, and the ability to make more. You can customize the color of the background, the border, the text and the color and style of keywords in text. You can also customize whether the title of a keyword should show up and how large the title should be. If you want to switch tooltip style you do that by simply swapping the scriptableObject in the TooltipManager. There is also the option of having a unique tooltip style for a specific tooltip or keyword.
